

<u>Sponsored by Collagenex</u> "Host Modulation Therapy for Oral Diseases"

Lecture/Dinner -- January 27, 2005, 6:30-9:30PM
At: Becker Parkin Educational Center
450 West 33rd Street (Bet. 9th and 10th Avenues)
New York, NY 10001

As science advances, it is more and more important to find a link between medicine and dentistry. We move away from mechanics, establishing a proper connection to medicine. This lecture will be the first one of many to foster such a relationship. The choice of topics is not coincidental. Periostatat, discovered by dentistry, is used to combat periodontal disease. It is now, in its final testing as a therapeutic modality for dermatological use, and is being under close investigation by other medical specialties. The aim of this lecture is informative, and it will improve the networking between Physicians and dentists.

Participating dentists will earn 2 CE credits recognized by the AGD.

Course Objectives:

- Describe current concepts in the disease process of cardiovascular disease, diabetes, osteoporosis, and periodontitis.
- Identify the role of inflammation and pro-inflammatory cytokines in above mentioned disease states.
- Recognize how systemic diseases affect the onset, rate, severity, and progression of periodontitis.
- Recognize, identify, and modulate treatment plans based on risk factors.
- Apply new effective protocols to better manage patients with systemic disease.
- Understand concept and application of Evidenced based Medicine and Dentistry.

About the Presenter:

Dr. Martin Greenfield currently is in private medical practice specializing in the fields of Osteoporosis, Endocrinology and Metabolism in Great Neck, New York. He received his training at Columbia University, SUNY Downstate Medical Center and His fellowship in Endocrinology at Brigham Hospital, Harvard Medical School.
